COMMERCIAL & TECHNICAL PROPOSAL

On-Demand Ride-Hailing & Fare Negotiation Platform

Bolt & inDrive Hybrid Fare Negotiation & Instant Dispatch Mobility Ecosystem

PREPARED EXCLUSIVELY FOR (CLIENT)
PHP Movers (PHP Movers Limited)
Attn: Executive Management & Operations Directorate

PROJECT SCOPE & TARGET PLATFORMS
Tri-Tier Ride-Hailing Ecosystem
Passenger Web/PWA App + Driver Partner App + Master Admin Desk

1. EXECUTIVE SUMMARY & HYBRID ARCHITECTURE

The objective of this engagement is to engineer, deploy, and scale a proprietary on-demand passenger mobility and ride-hailing platform custom-built for **PHP Movers**. The system is engineered specifically for the Nigerian urban transport ecosystem, merging the operational speed of **Bolt** (quick matching, live trip tracking, digital receipts) with the commercial flexibility of **inDrive** (fair fare bidding and passenger-driver price negotiation):

The Bolt Model (Instant Dispatch)
Engineered for commuters seeking an immediate ride. Automated distance-and-time pricing dispatches the nearest active driver instantly with zero price negotiation.

The inDrive Model (Fare Bidding)
Passengers propose their starting fare budget. Nearby active drivers receive the ride request and can accept, counter-bid, or decline in real time.

The platform connects everyday passengers with verified independent drivers while giving PHP Movers automated fee collection, commission management, and real-time operational oversight.

2. CORE PLATFORM MODULES

Module 1: Passenger Application (Web / Mobile PWA)

Passenger Facing

- **Trip Booking & Route Selection:** Interactive map interface powered by OpenStreetMap and Leaflet to select pickup and drop-off points with automatic route and distance computation.
- **Dual Booking Modes (Bolt + inDrive Mechanics):**
  - *Standard Match (Bolt Model):* Instant automated dispatch based on distance-and-time pricing.
  - *Fare Bidding (inDrive Model):* Passenger proposes a fare offer; nearby drivers can accept, counter-offer, or decline in real time.

- **Driver Tracking & Safety:** Real-time vehicle location tracking as the driver approaches, with estimated time of arrival (ETA), vehicle details (make, model, color, plate number), and driver rating.
- **Direct Communication & Trip Completion:** In-app calling and messaging button connecting rider and driver, and automatic digital trip receipts upon completion.
- **Start-of-Trip OTP Verification:** 4-digit security PIN provided to the passenger, required by the driver before initiating the trip.

Module 2: Driver Partner Application (Web / Mobile PWA)

`Driver Facing`

- **Driver Onboarding & Verification:** Digital registration portal collecting commercial driver license, vehicle particulars, roadworthiness documents, and bank account details (NUBAN) for payouts.
- **Trip Dispatch & Bidding Terminal:** Toggle online/offline status, audio and visual alerts for incoming passenger requests in radius, and one-tap bidding to accept the proposed fare or counter with a customized price.
- **Turn-by-Turn Navigation Bridge:** One-touch handover to Google Maps or Waze on the driver's phone for turn-by-turn route navigation.
- **Earnings & Commission Wallet:** Daily and weekly earnings summary, trip logs, and tracking of platform commission deductions.

Module 3: Central Operations & Master Admin Dashboard (PHP Movers HQ)

`Command & Control`

- **Driver & Vehicle Approval Desk:** Verify, approve, or reject new driver registrations and inspect vehicle document uploads before granting platform access.
- **Live Fleet & Dispatch Monitor:** Live administrative map view displaying all active trips, online drivers, and completed journeys.
- **Commission Engine:** Set dynamic platform service commission rates (e.g., 10% to 15% per completed trip) with cash-trip commission deduction from driver balances.
- **User Management & Dispute Resolution:** Track user ratings, handle trip disputes, manage SOS/emergency incident logs, and deactivate non-compliant accounts.

3. RECOMMENDED TECHNICAL ARCHITECTURE

To deliver high performance within a cost-effective budget, the platform avoids high-cost proprietary mapping licenses and builds on a lightweight, battery-efficient stack:

- **Frontend Apps (Passenger & Driver):** Developed in **Next.js (React)** styled with Tailwind CSS, packaged as installable **Progressive Web Apps (PWAs)** or lightweight Android APKs. This ensures zero download friction, small storage footprints on budget Android smartphones, and instant updates without app store review delays.
- **Backend API & Real-Time Sockets: Node.js (NestJS) with WebSockets** hosted on dedicated cloud worker dynos, handling sub-second bid updates, ride dispatch alerts, and location pings.
- **Database & Caching: PostgreSQL** for immutable trip ledgers and user records, paired with **Redis** for active driver coordinates and live room matching.
- **Cost-Controlled Geospatial Mapping:** Open-source tile routing (Leaflet / OpenStreetMap / MapLibre) to ensure map views do not generate heavy recurring Google Maps API bills.

4. ESTIMATED RUNNING & THIRD-PARTY OPERATIONAL COSTS

Infrastructure fees are paid directly by PHP Movers to service providers at transparent cost:

Infrastructure / Service	Operational Purpose	Estimated Initial Cost
Cloud Server (Backend API)	Runs core backend and dispatch logic on Railway.app	`$5.00 - $10.00 / month`
Database & Cache (PostgreSQL + Redis)	Stores user accounts, trip ledgers, and live sessions	`Included in cloud tier (~$5 - $10/mo total)`
Domain Name & Edge Security	Custom domain (e.g., .ng or .com) + Cloudflare SSL	`~$12.00 - $20.00 / year`
SMS OTP / Phone Verification	User phone number verification via Termii	`Pay-as-you-go (~₦5.00 per SMS)`
Map Routing & Tile Requests	Open-source map tiles (Leaflet / OSM)	`$0.00 (Free baseline tier)`
Payment Gateway Integration	Paystack / Moniepoint for in-app wallet top-ups	`1.5% per local transaction`
Google Play Developer Account	One-time account fee if deploying to Google Play Store	`$25.00 (One-off payment to Google)`

5. COMMERCIAL INVESTMENT & MILESTONE SCHEDULE

TOTAL PROJECT INVESTMENT

₦1,200,000

Delivery Timeline: 4 to 5 Weeks

All 3 Core Application Modules Included

Milestone	Deliverable Description	Payment Percentage & Amount
1. Mobilization Deposit	Paid upon signing of development agreement. Covers system architecture, database schema, and complete UI/UX interface design.	`50% (₦600,000)`
2. Functional Staging Milestone	Paid upon deployment of the core backend, driver bidding logic, and real-time mapping dispatch to the staging environment.	`30% (₦360,000)`
3. Production Handover & Go-Live	Paid upon live cloud deployment, domain linking, payment gateway verification, administrative training, and source code delivery.	`20% (₦240,000)`

6. POST-LAUNCH WARRANTY & ACCEPTANCE

Upon production go-live, Sales Cowboy provides **thirty (30) days of complimentary technical warranty support** covering software bug resolutions, server uptime surveillance, and administrative staff onboarding.
